

Mandate, company moment, and operating tensions

MAKE EXECUTION LEGIBLE BEFORE IT BECOMES URGENT.

Actual mandate hypothesis: Turn a broad, safety-critical operating business into a more coherent executive system - one that converts customer commitments, delivery risk, capacity constraints, operating signals, and cross-functional dependencies into faster decisions and reliable follow-through without adding unnecessary bureaucracy.

COMPANY MOMENT

Fleet-scale ambition

DOE financing partnership tied to long-lead items for up to 10 AP1000 units; advance purchase could accelerate deployment.

Repeatability pressure

Standard AP1000 reference plant intended to improve licensing and delivery predictability.

Operating-plant breadth

Engineering, outages, parts, digital optimization, I&C, plant services, staffing, and long-term operations.

Execution credibility

Cost, schedule, component-quality, supply-chain, and workforce risks remain central sector pressures.

OPERATING TENSIONS

Growth vs. execution discipline

More opportunity raises the cost of hidden dependencies and late escalation.

Speed vs. nuclear-grade governance

Decision latency matters, but safety, quality, regulatory, and technical authority cannot blur.

Portfolio breadth vs. one executive truth

Protect local judgment while giving leaders a coherent view.

Customer urgency vs. capacity planning

Field windows and commitments compete for scarce technical and supply capacity.

Global scale vs. local accountability

Standardize visibility and thresholds without centralizing every decision.

Executive Operating Envelope and decision architecture

THE FOUR-LAYER OPERATING MODEL

1. Commitment Map

Outcome | date | customer | owner | confidence | dependencies

2. Constraint Ledger

Capacity | parts | engineering | field window | quality/regulatory gates | aging

3. Decision Architecture

Threshold | owner | decision right | escalation route | aging | closure

4. Learning Registry

Recurring cause | reusable fix | standard work | planning assumption | adoption

SIX DECISIONS THE ROLE SHOULD MAKE EASIER

- 01Where does executive attention go now?
- 02What deserves intervention versus local resolution?
- 03Where should scarce expertise be allocated?
- 04Which commitment is losing confidence?
- 05What recurring failure mode needs a system fix?
- 06What work or reporting should stop?

ILLUSTRATIVE SCORECARD

DOMAIN	EXECUTIVE QUESTION	MEASURES TO DISCOVER / TEST
Reliability	Are commitments more predictable?	Milestone adherence schedule confidence recovery closure
Flow	Where is work waiting?	Blocked milestones constraint aging decision latency
Economics	Where does friction leak value?	Rework expedite burden preventable leakage
Trust	Do critical signals surface early?	Leading exceptions recurrence recovery confidence
Learning	Are lessons reused?	Repeat-cause rate standard adoption cross-team reuse

These are discovery hypotheses, not assertions about Westinghouse current KPIs.

Evidence map and hard objection

VERIFIED EVIDENCE -> ROLE TRANSFER

High-reliability technical execution

Evidence	Compunetics: engineering, manufacturing, quality, customer delivery, advanced electronics, complex technical programs.
Transfer	Direct experience where technical rigor and delivery consequence meet.

Scaled cadence and escalation

Evidence	Amazon: 24/7 launch and execution supporting approximately five million second-day orders annually.
Transfer	Direct experience with visible flow, standard work, escalation, and frontline adoption.

Regulated operations

Evidence	ZeusVu: regulated drone operations; 100% safety record; no FAA incidents.
Transfer	Disciplined execution and respect for operating authority in regulated contexts.

Cross-functional operating system

Evidence	Vape-Jet: production, purchasing, quality, customer success, support, engineering issue flow, ERP, CRM, telemetry, AI-assisted workflows.
Transfer	Current evidence connecting fragmented signals into priorities, handoffs, standards, and accountability.

AI tied to work and governance

Evidence	DudeWorth: AI-readiness frameworks, structured context, retrieval, agents, human judgment, escalation, decision records, evaluation, and governance rails.
Transfer	Useful only where it improves work, decisions, adoption, or economics.

HARD OBJECTION

"You have not spent your career inside a nuclear OEM or utility."

Correct. Adjacent experience is not direct nuclear experience. The value proposition is high-reliability operating discipline, cross-functional visibility, decision architecture, quality and root-cause mechanisms, regulated execution, and adoption. Nuclear authority remains with nuclear experts; the Chief of Staff mechanism should make their signals more visible and decisions easier to route.

First 120 days, executive questions, and sources

FIRST 120 DAYS

0-30 | Observe the work

Stakeholder and decision-rights map; review-cadence inventory; recurring-friction hypotheses.

31-60 | Build shared view

Commitment/dependency pilot; constraint-aging view; draft escalation thresholds.

61-90 | Test decision cadence

Decision log and aging; before/after meeting burden; signal-to-action audit.

91-120 | Scale what proves useful

Operating-envelope playbook; ownership/governance model; stop/start/continue review.

EXECUTIVE INTERVIEW QUESTIONS

1. Where does the leadership team spend disproportionate time reconciling different versions of reality?
2. Which decisions are routinely escalated too late - and which are escalated too often?
3. Where do customer urgency and internal capacity collide most often?
4. What execution risk worries the OPX leader that current dashboards do not reveal early enough?
5. What must remain local because judgment is closest to the work - and what benefits from standardization?
6. At the end of year one, what would make the executive team say the Chief of Staff materially changed how the business runs?
